Please note there is the potential for minor revisions of data in this report. Please check the online version at **bhi.nsw.gov.au** for any amendments.

Published March 2016

Hospital Quarterly reports present data at the point in time when data become available to BHI. Changes in data coverage and analytic methods from quarter to quarter mean that figures published in this document are superseded by subsequent reports. At any time, the most up-to-date data are available on BHI's online data portal, Healthcare Observer, at bhi.nsw.gov.au/healthcare_observer

The conclusions in this report are those of BHI and no official endorsement by the NSW Minister for Health, the NSW Ministry of Health or any other NSW public health organisation is intended or should be inferred.

Introduction

Every day around 25,000 people receive care in the NSW public hospital system. *Hospital Quarterly* is a series of regular reports that tracks services provided to the people of NSW and the timeliness with which they are provided.

The Hospital Quarterly report is structured around two key types of measures; activity and performance. Activity measures are used to describe the volume and type of services provided, while performance measures are used to describe the timeliness of service provision.

Within the section on activity, data are provided for emergency department (ED) presentations; hospital admissions; and elective surgery procedures (Figure i). Within the section on performance, data are provided for ED presentations and elective surgery procedures (Figure ii).

Hospital Quarterly appendix tables provide information about activity and performance in NSW public hospitals at a state, local health district (LHD), peer group and individual hospital level. Additional and comparative information about activity and performance in NSW public hospitals is available on the BHI interactive online portal, Healthcare Observer, at bhi.nsw.gov.au/healthcare_observer

About the data

The data used in *Hospital Quarterly* analyses are transmitted by the state's hospitals to centralised data warehouses administered by the NSW Ministry of Health. Hospital admission and ED data in this report were extracted from the NSW Health Information Exchange (HIE) on 3 and 5 February 2016. Elective surgery data were extracted from the Waiting List Collection On-line System (WLCOS) on 18 January 2016.

ED data are drawn from the Emergency Department Data Collection (EDDC). While not all EDs have systems in place to supply records to the EDDC, data coverage has increased over time. The ED data in this report cover 131 facilities for which consistent data have been reported to the EDDC for at least five quarters. These account for approximately 98% of all records in the EDDC and approximately 95% of ED presentations in NSW.

Hospital Quarterly reports on the percentage of patients who left the ED within four hours of presentation. Due to differences in data definitions, period of reporting and the number of hospitals included, Hospital Quarterly results, for this measure, are not directly comparable to figures reported by the NSW Ministry of Health or the Commonwealth. For more information refer to the technical supplements section of the BHI website at bhi.nsw.gov.au

Hospital admission data includes hospitalisations in public hospitals, privately managed hospitals contracted to supply services for public patients, public multi-purpose services, and public psychiatric hospitals. Non-admitted patients (including community residential care), organ donors (posthumously admitted), and hospital boarders are not included in these data. Newborn babies who are aged nine days or less at the time of admission and who do not require treatment for health problems are also not included in these data.

Elective surgery data include procedures performed during the quarter, and patients currently on the waiting list to receive surgery.

Context Measures Stratification Emergency departments (EDs) Activity Number of ED presentations Performance Number of ambulance arrivals Number of patients admitted/treated and discharged Number of admitted patient episodes Number of babies born Average length of stay Number of bed days Urgency category Number of elective surgery procedures Hospital peer group performed Urgency category Number of patients Specialty on waiting list Common procedure Specialty Number of patients still on waiting list after Common procedure more than 12 months

Figure i Hospital activity measures included in this report

About the measures

Hospital Quarterly uses a number of measures to report activity and performance in NSW public hospitals (Figures i and ii). Where the focus is on measuring activity, numbers and percentages are commonly used. Where the focus is on measuring performance in terms of timeliness of care (for example, waiting times for treatment in the ED or for elective surgery), the median and 90th or 95th percentile times are used. Timeliness is also reported using the percentage of patients receiving care within a defined time period. For example, the percentage of patients who arrived by ambulance that had their care transferred within 30 minutes, the percentage of patients leaving the ED within four hours, and the percentage of elective surgery performed within recommended timeframes are reported.

About the analyses

The data specifications and analytic methods used for *Hospital Quarterly* are described in the technical supplements section of the BHI website at bhi.nsw.gov.au

Hospital Quarterly includes a number of commonly used terms and classifications to describe activity and performance across EDs, hospital admissions and elective surgery. These are described in Table 4 (page 49).

Making direct comparisons of activity and performance between hospitals is not straightforward. For valid comparisons to be made it is important to consider similar hospitals together. To do this, Hospital Quarterly uses a NSW Health classification system called 'hospital peer groups' as the basis for comparison (Table 1). An index of NSW public hospitals by LHD and hospital peer group can be found on page 53 of this report.

Urgency categories should also be considered in making fair comparisons in activity and performance across EDs and for elective surgery. See Table 4 (page 49) for a description of ED triage categories and elective surgery urgency categories.

Percentages in this report are rounded and therefore may not sum to 100%. Percentages greater than 99.5% are rounded to 100%.

Table 1 NSW public hospital peer groups

Peer group	Name	Description
A1	Principal referral	Very large hospitals providing a broad range of services, including specialised units at a state or national level.
A2	Paediatric specialist	Specialist hospitals for children and young people.
A3	Ungrouped acute – tertiary referral	Major specialist hospitals that are not similar enough to any other peer group to be classified with them.
В	Major	Large metropolitan and non-metropolitan hospitals.
C1	District group 1	Medium sized hospitals treating between 5,000-10,000 patients each year.
C2	District group 2	Smaller hospitals typically in rural locations.

Context Measures Stratification Emergency departments (EDs) Activity Median time to treatment Performance 95th percentile time to treatment Median time to leaving ED 95th percentile time to leaving the ED Percentage of patients leaving the ED within four hours Percentage of ambulance arrivals with transfer of care within 30 minutes Median transfer of care time 95th percentile transfer of care time Urgency category Median waiting time Specialty for elective surgery Common procedure 90th percentile Urgency category waiting time for Hospital peer group elective surgery Urgency category Percentage of Specialty elective surgery Common procedure performed on time Hospital peer group

Key findings

Hospital activity measures – October to December 2015

How many people presented at NSW emergency departments?

Compared with the same quarter last year:

- 11,900 more patients presented to NSW emergency departments (EDs) (664,837 presentations in total; up 2%). Most (96%) were unplanned (emergency presentations).
- 4,312 more patients were in triage category two (up 6%), 9,889 more were in triage category three (up 5%), 857 more were in triage category four (up less than 1%) and 2,946 fewer were in triage category five (down 4%)
- 4,337 less patients arrived by ambulance (136,390 patients in total; down 3%).

Where did patients go after leaving the emergency department?

Compared with the same quarter last year:

- 5,301 more patients were treated and discharged (64% overall)
- 4,191 more patients were treated and admitted to hospital (27% overall)
- 1,607 more patients left without, or before completing, treatment (5% overall)
- 726 more patients were transferred to another hospital (2% overall).

How many patients were admitted to public hospitals?

Compared with the same quarter last year:

- 4,575 more admitted patient episodes were recorded (467,013 in total; up 1%). Most (96%) were acute care episodes.
- 7,621 more bed days were recorded (1,640,261 in total; up less than 1%), and 9,961 more acute bed days (1,372,889 in total; up 1%)
- The average length of stay for an acute overnight admitted patient episode was unchanged at 4.8 days

• 284 fewer babies were born (17,693 babies in total); down 2%).

How many elective surgery procedures were performed?

Compared with the same quarter last year:

- 830 fewer elective surgery procedures were performed (53,438 procedures in total; down 2%).
 Of all elective surgery procedures performed this quarter:
 - 12,199 (23%) were categorised as urgent
 - 17,812 (33%) were categorised as semi-urgent
 - 20,925 (39%) were categorised as non-urgent
 - 2,502 (5%) were categorised as staged.

How many patients were on the waiting list for elective surgery?

Compared with the same quarter last year:

- 1,542 more people were ready for surgery and on the elective surgery waiting list at the end of the quarter (73,304 in total; up 2%). Of these:
 - 838 people (1%) were waiting for urgent surgery
 - 10,484 (14%) were waiting for semi-urgent surgery
 - 61,982 (85%) were waiting for non-urgent surgery.
- At the end of the quarter, more people were still
 waiting for semi-urgent and non-urgent surgery
 (up 1% and 2% respectively) and fewer people
 were waiting for urgent surgery (down 4%)
 compared with the same quarter last year.

Table 2 provides a summary of NSW public hospital activity measures for October to December 2015.

Key findings

Hospital performance measures – October to December 2015

How long did patients wait for ED treatment?

Compared with the same quarter last year:

- The percentage of patients that had their care transferred from ambulance to ED staff within 30 minutes was five percentage points higher at 91%
- The median time from presentation at the ED to starting treatment was largely unchanged across all triage categories (increased by one minute for triage categories four and five)
- The 95th percentile time to starting treatment increased for patients in triage categories three, four and five (one, six and seven minutes respectively).

How long were patients in the ED?

Compared with the same quarter last year:

- The median time to leaving the ED was three minutes longer and 95th percentile time to leaving was 10 minutes longer
- There was a decrease in the percentage of patients who left the ED within four hours (74% this quarter; down one percentage point)
- The percentage of patients leaving within four hours increased in 40 out of 81 hospitals, compared with the same quarter last year.
 Nine hospitals increased more than five percentage points.
- The percentage of patients leaving within four hours decreased in 41 hospitals, compared with the same quarter last year. Nine hospitals decreased more than five percentage points; with two that decreased more than 10 percentage points.

How long did patients wait for elective surgery?

Compared with the same quarter last year:

- The median waiting times for urgent and semiurgent elective surgery did not change (10 and 44 days respectively), while the median waiting time for non-urgent surgery increased by nine days to 223 days.
- The 90th percentile waiting time for urgent and non-urgent elective surgery increased by one day (26 and 358 days respectively), and was unchanged for semi-urgent surgery (83 days).

Was elective surgery performed on time?

Compared with the same quarter last year:

- The percentage of elective surgery performed within recommended timeframes was unchanged at 97%. This included:
 - 100% of urgent surgery (unchanged)
 - 97% of semi-urgent surgery (unchanged)
 - 95% of non-urgent surgery (down one percentage point).
- The percentage of elective surgery performed on time increased in 21 out of 82 hospitals, compared with the same quarter last year. Three hospitals increased more than 10 percentage points.
- The percentage of elective surgery performed on time decreased in 33 hospitals, compared with the same quarter last year. Seven hospitals decreased more than five percentage points; including one that decreased more than 10 percentage points.

- Among specialties, vascular surgery and gynaecology had the highest percentage of patients who received surgery on time (both 99%). Ear, nose and throat surgery and orthopaedic surgery (91% and 95% respectively) had the lowest.
- Among common procedures, hysteroscopy (99%), varicose veins stripping and ligation, coronary artery bypass graft and cholecystectomy (all 98%) had
- the highest percentage of patients who received surgery on time. Myringoplasty/tympanoplasty (80%) and septoplasty (89%) had the lowest.

Table 3 provides a summary of NSW public hospital performance measures for October to December 2015.

Table 3 Summary of NSW public hospital performance measures, October to December 2015

How many people presented at NSW emergency departments?

During the October to December 2015 quarter, a total of 664,837 people presented to NSW public hospital emergency departments (EDs), an increase of 2% compared with the same quarter last year. Almost all were emergency presentations (638,956 patients or 96%) (Figure 1). The remaining 4% (25,881 patients) presented to ED for non-emergency reasons such as a planned return visit, or a planned hospital admission.

Most of the increase in ED presentations this quarter was due to a 6% increase in the number of patients in triage category two (4,312 more patients) and a 5% increase in the number in triage category three (9,889 more patients). There was a 2% increase in the number of patients in triage category one (82 more patients), less than 1% increase in triage category four (857 more patients), and a decrease of 4% in triage category five (2,946 less patients) (Figure 1).

There has been a sizeable increase in the number of emergency presentations over time, from 526,601 in October to December 2010 to 638,956 this quarter,

representing a 21% increase over the past five years (Figure 2).

The number of ED presentations increased this quarter in the majority of NSW hospitals (54 out of 81) (Figure 3). Fifteen hospitals had an increase of more than 5%, including six that increased by more than 10%. Eight hospitals had a decrease of more than 5% in the number of ED presentations this quarter, including three that decreased by more than 10%. Hospitals identified in Figure 3 are those that had more than 5,000 ED presentations this quarter and more than a 5% change in the number of presentations compared with the same quarter last year.

This quarter, 136,390 ED patients arrived by ambulance, a decrease of 3% compared with the same quarter last year (Figure 1).

Emergency presentations are ED presentations for emergencies, unplanned return visits or disaster.

Figure 1 Emergency department presentations and ambulance arrivals at NSW emergency departments, October to December 2015

		This quarter	Same quarter last year	Change since one year ago

Figure 2 Emergency presentations and ambulance arrivals at NSW emergency departments,
October 2010 to December 2015

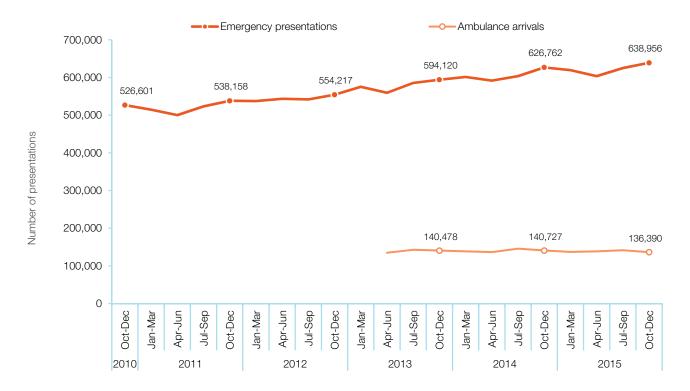

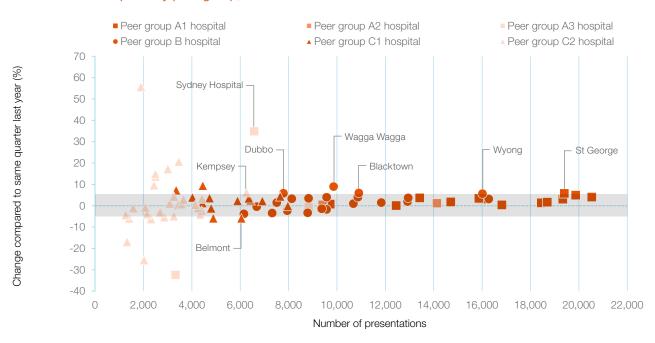

Figure 3 Change in emergency department presentations compared with the same quarter last year, hospitals by peer group, October to December 2015

Where did patients go after leaving the emergency department?

There are different ways in which a patient can leave the ED; referred to as mode of separation. The majority of patients either leave after their treatment is complete or they are admitted to hospital. Some patients choose not to wait for treatment and leave, and others are transferred to a different hospital.

During the October to December 2015 quarter, 64% of patients (424,314) were treated and discharged from the ED, and 27% (180,228) were treated and admitted to hospital; up 1% and 2% respectively compared with the same quarter last year.

The number of patients transferred to another hospital increased by 6% this quarter (13,620) and the number who left without, or before completing, treatment (35,709) increased by 5%, compared with the same quarter last year (Figure 4).

ED patients in triage categories one and two were more likely to be treated and admitted to hospital this quarter (Figure 5), whereas those in triage categories three, four and five were more likely to be treated and discharged (Figure 6).

There has been an increase in the number of patients who were treated and discharged, treated and admitted to hospital, and transferred to another hospital since the same quarter in 2010. During this time, there has been a decrease in the number of patients who left without, or before completing, treatment (Figure 7).

Figure 4 Patients leaving the emergency department, by mode of separation, October to December 2015

		This quarter	Same quarter last year	Change since one year ago
Treated and discharged	64	1% 424,314	419,013	1%
Treated and admitted to hospital	27%	180,228	176,037	2%
Patient left without, or before completing, treatment	5%	35,709	34,102	5%
Transferred to another hospital	2%	13,620	12,894	6%
Other	2%	10,966	10,891	1%

Figure 5 Percentage of patients treated and admitted, by triage category, October to December 2015

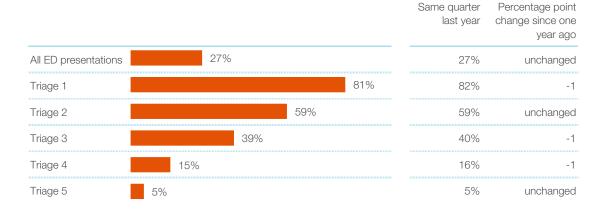

Figure 6 Percentage of patients treated and discharged, by triage category,
October to December 2015

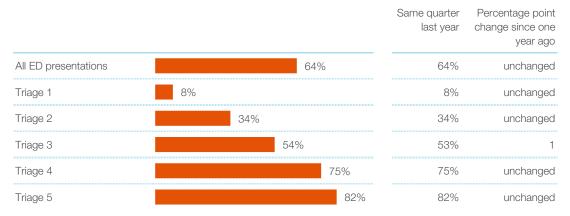

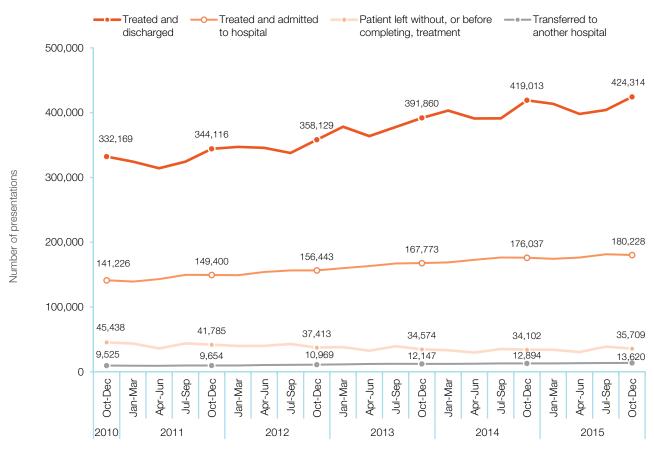

Figure 7 Patients leaving the emergency department, by mode of separation, October 2010 to December 2015

How many patients were admitted to public hospitals?

During the October to December 2015 quarter, there were 467,013 admitted patient episodes; up 1% compared with the same quarter last year (Figure 8). The majority were acute admitted patient episodes (96%) and of this, 54% were for overnight care and 46% were for same-day care (Figure 9).

Hospital admissions can be planned (arranged in advance) or unplanned (for example, emergency hospital admissions or unplanned surgical procedures). This quarter, the majority of acute same-day admitted patient episodes (73%) were planned. Similarly, the majority of overnight episodes (84%) were unplanned.

There has been a gradual increase over the past five years in all admitted patient episodes and all acute admitted patient episodes (Figure 8). During this time, the number of acute overnight admitted patient episodes has increased by 10% and the number of same-day episodes increased by 17% (Figure 9).

Figure 10 shows differences in the percentage of all same-day acute care admissions this quarter across hospital peer groups. Peer group C2 hospitals had a higher percentage of same-day admissions than other peer groups and also had the widest range – 19% to 100% of all acute admissions being for same-day care.

The number of babies born in NSW public hospitals (17,693) was down 2% compared with the same quarter last year (Figure 8).

Patients can have more than one admitted episode during the same hospital admission. For example, a person may be admitted for acute care and then require an episode of rehabilitation or palliative care prior to being discharged.

Figure 8 All admitted patient episodes, acute admitted patient episodes and babies born,
October 2010 to December 2015

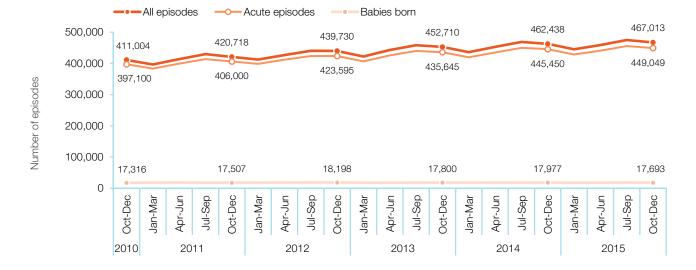

Figure 9 Overnight and same-day acute admitted patient episodes, October 2010 to December 2015

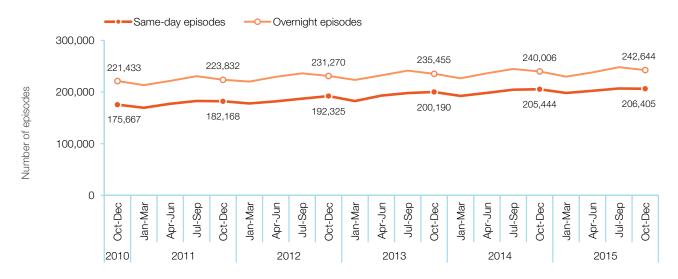

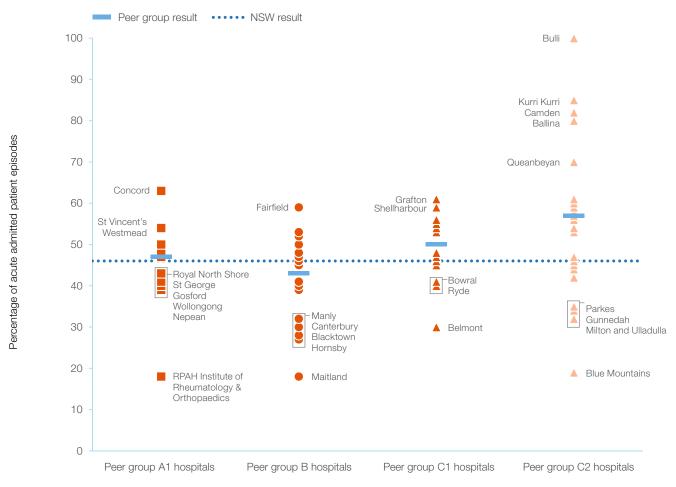

Figure 10 Same-day admitted patient episodes as percentage of all acute admitted patient episodes, by peer group, October to December 2015

How long did patients stay in hospital?

Bed days are an important measure of hospital utilisation and service provision. During the October to December 2015 quarter, 1,640,261 hospital bed days were recorded across all admitted patient episodes; down less than 1% compared with the same quarter last year. The majority of bed days (84%) were for acute care, which increased 1% this quarter. The number of non-acute bed days decreased by 1% compared with the same quarter last year (Figure 11).

There has been a 4% increase in the number of bed days for acute care between October 2010 and December 2015. During this time, the number of bed days for non-acute care increased by 20% (Figure 12).

The average length of stay for all acute admissions was 3.1 days this quarter, unchanged compared with the same quarter last year. The average length of stay for acute overnight admissions was 4.8 days, also unchanged compared with the same quarter last year. Figure 13 shows that the average length of stay for all acute admissions has remained unchanged in the same quarter over the past three years.

There were hospital-level differences in the average length of stay for acute overnight admissions this quarter, even within peer groups. The greatest variation was in the C2 peer group, where there was a 6.7 day difference between the highest and lowest average length of stay for individual hospitals, compared with a 2.1 day difference in the B peer group (Figure 14).

October to December 2015

How many elective surgery procedures were performed?

During the October to December 2015 quarter, a total of 53,438 elective surgery procedures were performed, 830 (2%) fewer than in the same quarter last year. Of all the elective surgery procedures performed this quarter, 23% were categorised as urgent, 33% as semi-urgent, and 39% as non-urgent. A further 5% were categorised as staged (Figure 15).

Staged surgery is surgery that, for medical reasons, cannot take place before a certain amount of time has elapsed. For measures of surgical activity,

BHI includes all non-urgent cystoscopy procedures in the staged category.

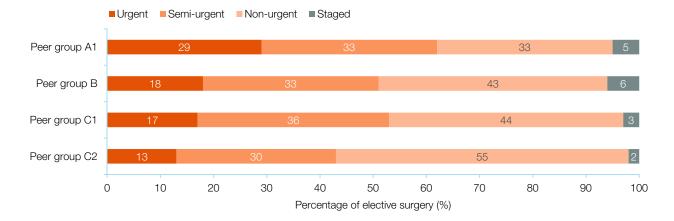

Compared with the same quarter last year, there was a small change in the number of urgent and semiurgent procedures performed and 1% increase in the number of non-urgent procedures performed.

There are three elective surgery urgency categories, each with a clinically recommended maximum time by which the procedure should be performed: urgent (within 30 days), semi-urgent (within 90 days) and non-urgent surgery (within 365 days).

Figure 15 Elective surgery procedures performed, by urgency category, October to December 2015

		This quarter	Same quarter last year	Change since one year ago
Total number of elective surgery procedures		53,438	54,268	-2%
Urgent 23%		12,199	12,260	<1%
Semi-urgent	33%	17,812	17,836	<1%
Non-urgent	39%	20,925	20,753	1%
Staged 5%		2,502	3,419	-27%

Figure 16 Distribution of urgency categories within all elective surgery procedures, by peer group,
October to December 2015

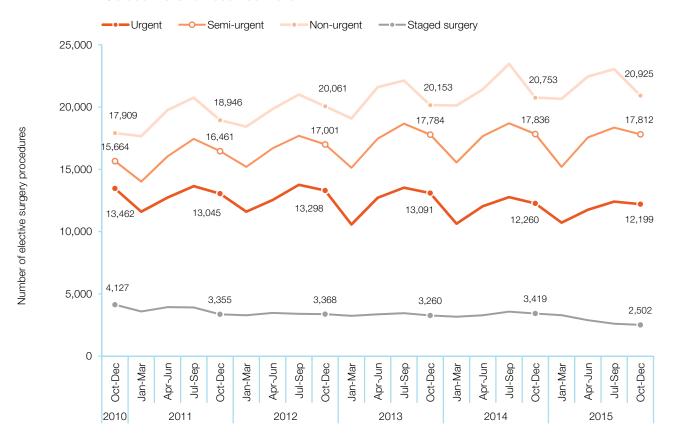

The number of staged procedures decreased by 27% compared with the same quarter last year (Figure 15).

Figure 16 shows variation in the distribution, by urgency category, of all elective surgery procedures performed across different hospital peer groups. Peer group A1 hospitals had the highest percentage of elective surgery procedures that were urgent and the lowest percentage that were non-urgent, compared with other hospital peer groups.

There has been an overall increase in the volume of elective surgery procedures performed over the past five years. The number categorised as semi-urgent and non-urgent increased by 14% and 17% respectively. The number categorised as urgent decreased by 9% and the number categorised as staged decreased by 39% during this time (Figure 17).

Figure 17 Elective surgery procedures performed, by urgency category,
October 2010 to December 2015

How many patients were on the elective surgery waiting list at the end of the quarter?

At the end of December 2015, 73,304 patients were ready for surgery and on the elective surgery waiting list. Of these, 1% were waiting for urgent surgery, 14% were waiting for semi-urgent surgery and 85% were waiting for non-urgent surgery. Compared with the same quarter last year, the number of patients waiting for urgent surgery decreased by 4% and the number waiting for semi-urgent and non-urgent elective surgery increased by 1% and 2% respectively (Figure 18).

At the end of the quarter, 13,964 patients were not ready for surgery and on the elective surgery waiting list, up 5% compared with the same quarter last year (Figure 18).

Comparing across surgical specialties

Orthopaedic surgery and ophthalmological surgery were the specialties with the most patients waiting at the end of the quarter. Together, these specialties made up 49% of all patients waiting for elective surgery in NSW public hospitals. Cardiothoracic surgery and medical (non-specialist) surgery had the least number of patients waiting (Figure 19).

At the end of the quarter, there were 355 patients still waiting for surgery after more than 12 months on the waiting list; a 30% increase compared with the same quarter last year. Orthopaedic surgery, ear, nose and throat surgery and general surgery had the most

patients still waiting after more than 12 months on the waiting list. Compared with the same quarter last year, the largest increase in absolute numbers was for orthopaedic surgery which increased from 58 to 129 patients (Figure 19).

Comparing across common procedures

Cataract extraction, the highest volume procedure, had the most patients waiting for surgery at the end of the quarter (15,092 patients, up 3% compared with the same quarter last year). Procedures with the least patients waiting were coronary artery bypass graft (87 patients; down 18%) and myringotomy (121 patients; down 12%) (Figure 20).

At the end of the quarter, total knee replacement and septoplasty had the most patients still waiting for surgery after more than 12 months on the waiting list (28 and 19 patients respectively) (Figure 20).

Figure 18 Elective surgery waiting list, by urgency category, as at 31 December 2015

	This quarter	Same quarter last year	Change since one year ago
Patients ready for surgery on waiting list as at 31 December 2015	73,304	71,762	2%

Transfer of care	37

NSW elective surgery

This section provides information about timeliness measures for elective surgery in NSW public hospitals.

Waiting times for elective surgery	39	
Percentage of elective surgery procedures performed on time	43	

How long did patients wait for treatment in the emergency department?

During the October to December 2015 quarter, the median time from a patient first presenting at the emergency department (ED) to starting treatment was one minute longer across triage categories four and five and unchanged for patients in triage category two and three, compared with the same quarter last year (Figure 21).

The 95th percentile time to starting treatment increased across triage categories three (one minute longer), four (six minutes longer), and five (seven minutes longer) (Figure 21).

How have ED treatment waiting times changed over time?

The median time to starting treatment has remained unchanged in the October to December quarter over the past five years for patients in triage category two. There has been a decrease over the past five years in the median time to starting treatment for patients in triage categories three, four and five (Figure 22).

Figure 23 shows a downward trend over the past five years across all triage categories in the 95th percentile time to starting treatment.

Figure 21 Time from presentation to starting treatment, by triage category, October to December 2015

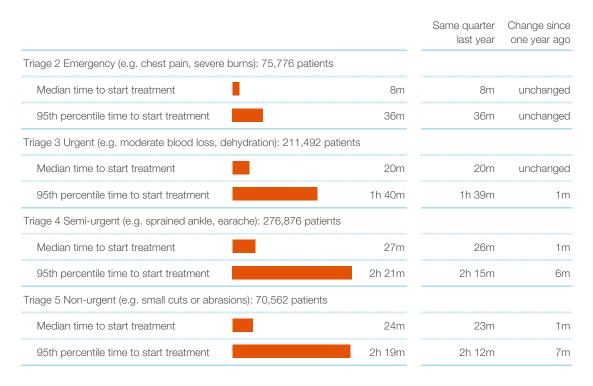

Figure 22 Median time from presentation to starting treatment, by triage category,
October 2010 to December 2015

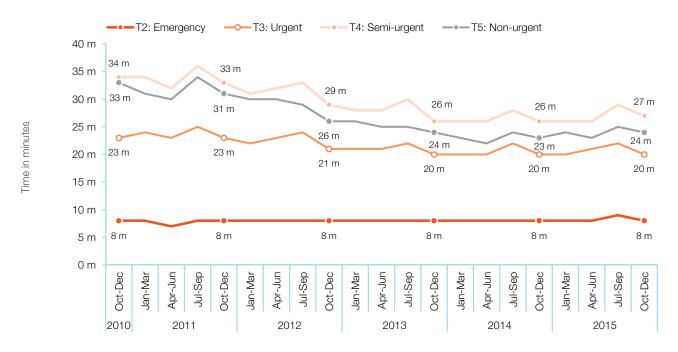

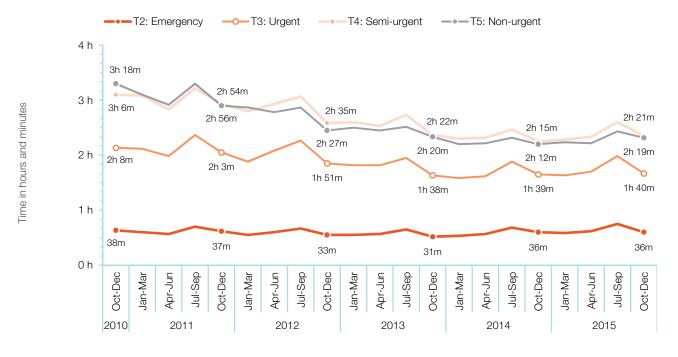

Figure 23 95th percentile time from presentation to starting treatment, by triage category,
October 2010 to December 2015

Time to leaving the emergency department

During the October to December 2015 quarter, the median time from presentation to leaving the ED was two hours and 41 minutes, three minutes longer than the same quarter last year. The 95th percentile time to leaving was nine hours and 32 minutes, 10 minutes longer than the same quarter last year (Figure 24).

Does time to leaving the ED vary between hospital peer groups?

Figure 25 shows the median time from presentation to leaving the ED over the past five years for peer group A1, B, C1 and C2 hospitals. The shaded areas illustrate the range of values between the highest and lowest median times for hospitals in each peer group.

Overall, peer group A1, B and C1 hospitals have seen a decrease in the median time to leaving the ED over the past five years. For peer group C2 hospitals, however, the median time to leaving has increased, and was 10 minutes longer this quarter than in the same quarter in 2010 (Figure 25).

There is now little variation in the median time to leaving the ED between hospitals in peer group A1, as evidenced by a narrowing of the difference between the highest and lowest median times for individual hospitals. More variation is seen in the median time to leaving the ED for peer group B, C1 and C2 hospitals (Figure 25).

Patients generally spend less time in the ED in peer group C1 and C2 hospitals (Figure 25). Correspondingly, these hospitals generally have a higher percentage of patients who leave within four hours of presentation, compared with other peer groups (Figure 31).

The cohort of EDs included in this report has changed over the past five years, and this has affected overall volumes and performance measures. Results for peer group C2 hospitals are most affected by these changes. The number of EDs in peer group C2 hospitals that contribute data to *Hospital Quarterly* has more than doubled since 2010. For more information refer to the technical supplements section of the BHI website at bhi.nsw.gov.au

Median time to leaving the emergency department and range, peer group hospitals, Figure 25

2010

2011

2015

2014

Time to leaving the emergency department by mode of separation

The median time to leaving the ED increased this quarter across all modes of separation, compared with the same quarter last year. For patients whose ED visit ended in admission to hospital, the median time to leaving the ED was seven minutes longer (Figure 26).

The 95th percentile time to leaving the ED was one minute longer for people treated and discharged and 17 minutes longer for those treated and admitted to hospital, compared with the same quarter last year. For patients transferred to another hospital, the 95th percentile time to leaving ED was 24 minutes longer (Figure 27).

Has time to leaving the ED changed by mode of separation?

Despite a 24% increase in the volume of presentations since the October to December quarter in 2010, overall, the median time from presentation to leaving the ED has decreased from three hours and 13 minutes to two hours and 41 minutes this quarter.

Figure 26 shows a downward trend over the past five years in the median time across all modes of separation. The largest decrease was seen for patients who were treated and admitted to hospital, from six hours and 32 minutes in October to December 2010 to four hours and 42 minutes this quarter.

Compared with the same quarter in 2010, the 95th percentile time to leaving the ED has decreased across all modes of separation. Patients transferred to another hospital had the largest decrease, from 22 hours and two minutes in October to December 2010 to 18 hours and 55 minutes this quarter (Figure 27).

Figure 26 Median time from presentation to leaving the emergency department,
October 2010 to December 2015

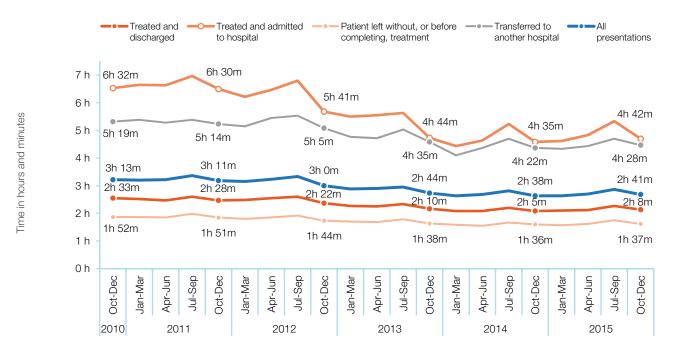

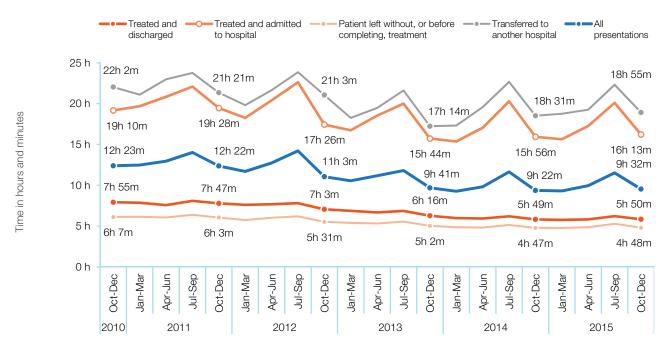

Figure 27 95th percentile time from presentation to leaving the emergency department,
October 2010 to December 2015

Percentage of patients leaving the ED within four hours of presentation

During the October to December 2015 quarter, 74% of patients left NSW EDs within four hours of presentation, a decrease of one percentage point compared with the same quarter last year (Figure 28). The trend of improvement seen from mid-2012 onwards is no longer evident in these results (Figure 29).

The majority of patients who were treated and discharged this quarter left the ED within four hours (86%). Patients who were treated and subsequently admitted to hospital, and those who were transferred to another hospital, had the lowest percentage of patients who left within four hours (43% and 46% respectively). Of patients who left without, or before, completing treatment, 91% had departed the ED within four hours of presentation (Figure 28).

Currently, patients admitted to hospital are less likely to leave within four hours than patients who are treated and discharged, transferred to another hospital, or who leave without, or before completing, treatment (Figure 28).

While 74% of patients left the ED in the first four hours of presentation this quarter, a further 19% left between four and eight hours, and a further 4% left within the period of eight to 12 hours of presentation (Figure 30).

Due to differences in data definitions, period of reporting and the number of hospitals included, Hospital Quarterly results for the percentage of patients who left the ED within four hours are not directly comparable to figures reported by the NSW Ministry of Health or the Commonwealth. For more information refer to the technical supplements section of the BHI website at bhi.nsw.gov.au

Figure 28 Percentage of patients leaving the emergency department within four hours, by mode of separation, October to December 2015

		Same quarter last year	Percentage point change since one year ago

Transferred to another hospital	46%	46%	unchanged

Figure 29 Percentage of patients who left the emergency department within four hours, by mode of separation, October 2010 to December 2015

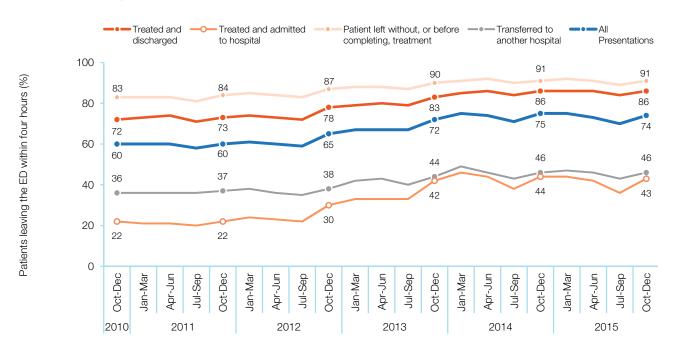

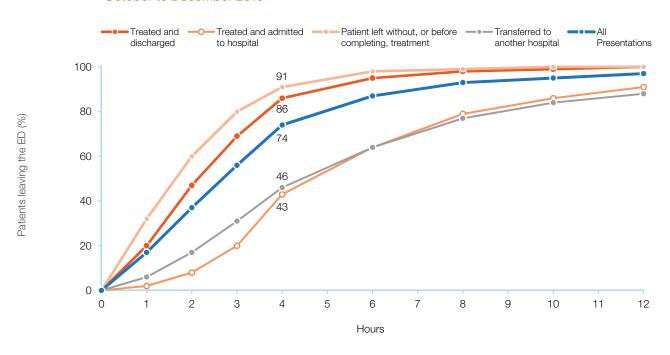

Figure 30 Percentage of patients leaving the emergency department, by time and mode of separation,
October to December 2015

Variation in the percentage of patients leaving the ED within four hours

There is considerable variation between and within hospital peer groups in the percentage of patients leaving the ED within four hours. Figure 31 shows that peer group C2 hospitals generally have a higher percentage of patients leaving the ED within four hours compared with other peer group hospitals. Peer group A1 hospitals generally have a smaller percentage of patients leaving within four hours.

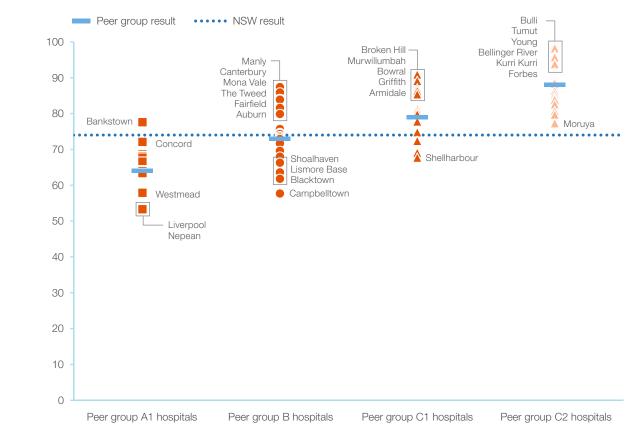

Figure 32 shows the percentage of patients leaving the ED within four hours by individual hospitals this quarter (Y-axis) and the percentage point change since the same quarter last year (X-axis). Hospitals shown above the blue NSW line had a higher percentage of patients leaving the ED within four hours this quarter compared with the overall NSW result, while those below this line had a lower

percentage of patients leaving within four hours compared with the NSW result. Hospitals shown to the left of the vertical '0' line had lower results, compared with the same quarter last year, while those shown to the right of the vertical line had higher results.

Hospitals in the upper right quadrant (Figure 32) achieved higher results than NSW overall, and increased the percentage leaving within four hours, compared with the same quarter last year. Hospitals in the upper left quadrant also had results that were higher than NSW but decreased the percentage leaving within four hours.

Hospitals in the lower right quadrant had results that were lower than NSW overall, but increased the percentage of patients leaving within four hours.

Figure 31 Percentage of patients leaving the emergency department within four hours of presentation, by peer group, October to December 2015

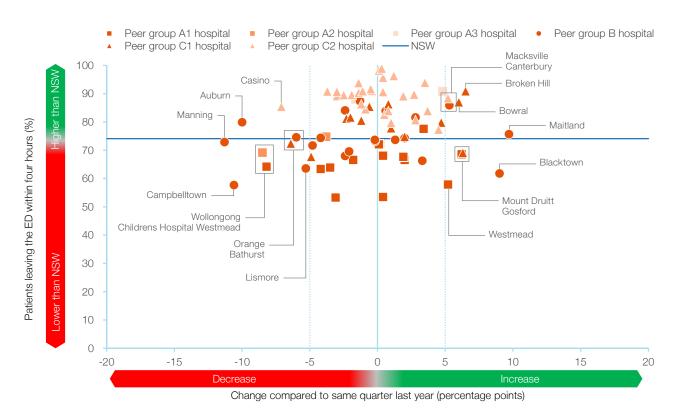

Hospitals in the lower left quadrant had results that were lower than NSW and a decrease the percentage leaving within four hours, compared with the same quarter last year.

Hospitals identified in Figure 32 are those that had an increase or a decrease in the percentage of patients leaving within four hours of more than five percentage points compared with the same quarter last year.

This quarter, the percentage of patients leaving the ED within four hours of presentation increased in 40 out of 81 hospitals. Of these, nine hospitals had an increase of more than five percentage points, compared with the same quarter last year (Figure 32).

The percentage of patients leaving the ED within four hours decreased in 41 hospitals. Of these, nine hospitals had a decrease of more than five percentage points, including two that had a decrease of more than 10 percentage points (Figure 32).

Figure 32 Percentage of patients leaving within four hours and percentage point change since same quarter last year, hospitals by peer group, October to December 2015

How long were patients in the emergency department?

Change over time in percentage of patients leaving within four hours

Compared with the same quarter last year, there was no change in the percentage of patients leaving ED within four hours in hospital peer group A1. There was a decrease of one percentage point in peer group B and an increase of one percentage point in peer group C1 and C2 (Figure 33).

With the exception of peer group C2, all peer groups had a decrease in the percentage treated and admitted to hospital who had left within four hours. Peer group A1 hospitals also had a decrease in the percentage transferred to another hospital who had left within four hours (Figure 34).

Within peer groups over the past five years, there has been an increase in the percentage of patients who left within four hours across all modes of separation, with the exception of peer group C2 for those treated and admitted to hospital (Figure 34). The most marked improvements were seen in the 18 months following mid-2012. More recently however, results have plateaued (Figure 33).

Over the past five years, peer group C1 and C2 hospitals have had a consistently higher percentage of patients who left the ED within four hours compared with peer group A1 and B hospitals (Figure 33). The slight decrease seen over the past five years in the percentage of patients leaving C2 peer group hospitals within four hours may be, in part, due to the addition of 14 new C2 hospitals to the Hospital Quarterly report since 2010.

Percentage of patients leaving the emergency department within four hours, by peer group, Figure 33 October 2010 to December 2015

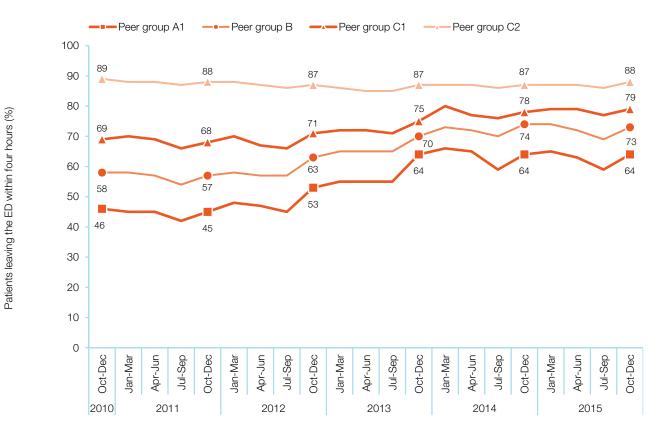

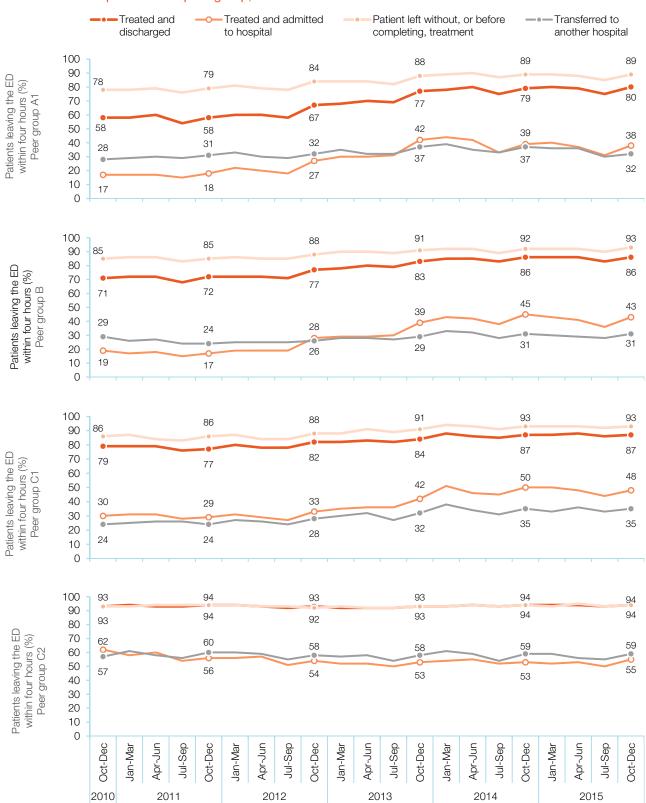

Figure 34 Percentage of patients leaving the emergency department within four hours, by mode of separation and peer group, October 2010 to December 2015

How many patients who arrived by ambulance had their care transferred within 30 minutes?

During the October to December 2015 quarter, 136,390 patients arrived at NSW EDs by ambulance (down 3% compared with the same quarter last year). This quarter, 119,933 patient records (matched between ambulance service and ED records) were used to calculate transfer of care time (Figure 35).

The median transfer of care time from ambulance to ED staff (12 minutes) was one minute shorter this quarter and the 95th percentile transfer of care time (42 minutes) was 16 minutes shorter compared with the same quarter last year (Figure 35).

In NSW, there is a target of 90% of patients that should have their care transferred from ambulance to ED staff within 30 minutes. This quarter, 91% of patients arriving by ambulance had their care transferred within 30 minutes; five percentage points higher than in the same quarter last year (Figure 36).

Figure 37 shows variation between and within hospital peer groups in the percentage of patients who had their care transferred within 30 minutes this quarter.

For some smaller NSW hospitals, transfer of care times reported in Hospital Quarterly are being assessed for data quality and results should be interpreted with caution.

Figure 35 Emergency department transfer of care time, October to December 2015

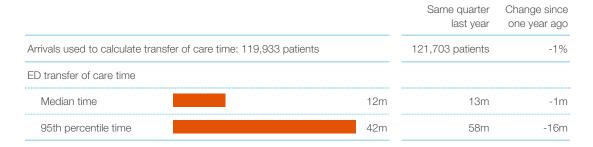

Figure 36 Percentage of ambulance arrivals with transfer of care time within 30 minutes,
April 2013 to December 2015

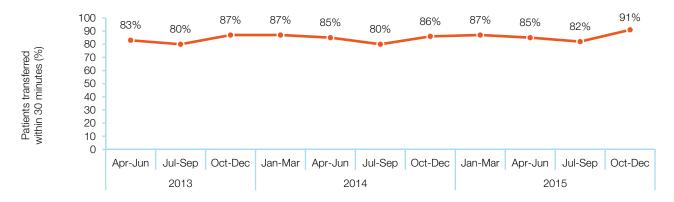

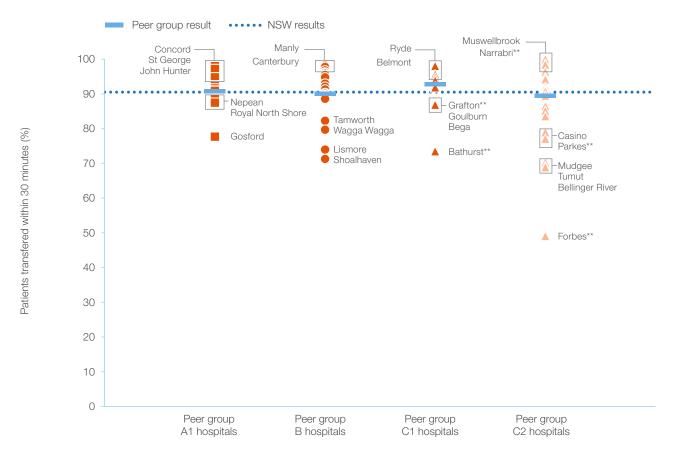

Figure 37 Percentage of ambulance arrivals with transfer of care time within 30 minutes, by peer group, October to December 2015

^(**) Use caution when interpreting these results – more than 30% of total records where transfer of care cannot be calculated.

How long did patients wait for elective surgery?

During the October to December 2015 quarter, the median waiting time for urgent surgery was 10 days (Figure 38) and this has remained largely unchanged in the same quarter over the past five years (Figure 39). The median waiting time for semi-urgent surgery (44 days) was unchanged compared with the same quarter last year, while the median waiting time for non-urgent surgery (223 days) increased by nine days (Figure 38).

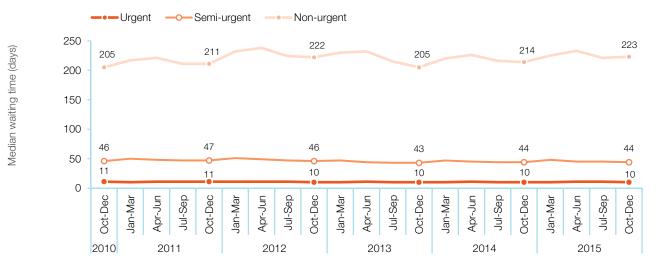

Compared with the same quarter in 2010, the median waiting time for urgent and semi-urgent surgery has decreased by one and two days respectively and the median waiting time for non-urgent surgery has increased by 18 days (Figure 39).

There has been a downward trend in the 90th percentile waiting times for elective surgery across all urgency categories since the October to December 2010 quarter (Figure 40).

Figure 38 Waiting times for elective surgery, by urgency category, October to December 2015

	Same quarter last year	Change since one year ago
Urgent: 12,199 patients		
Median time to receive surgery 10 days	10 days	unchanged
90th percentile time to receive surgery 26 days	25 days	1 day
Semi-urgent: 17,812 patients		
Median time to receive surgery 44 days	44 days	unchanged
90th percentile time to receive surgery 83 days	83 days	unchanged
Non-urgent: 20,925 patients		
Median time to receive surgery 223 days	214 days	9 days
90th percentile time to receive surgery 358 days	357 days	1 day

Figure 39 Median waiting time for elective surgery, by urgency category, October 2010 to December 2015

Compared with the same quarter in 2010, the largest decrease in the 90th percentile waiting time for elective surgery was for procedures categorised as semi-urgent (seven days less) (Figure 40).

Figure 41 shows the percentage of elective surgery completed by day and urgency category. The lines drawn at 30 days, 90 days and 365 days represent the recommended times for patients to receive surgery in each urgency category.

Across NSW, 90% of elective surgery procedures were completed before the end of the recommended timeframes; four days earlier for urgent surgery, seven days earlier for semi-urgent surgery and seven days earlier for non-urgent surgery (Figure 41).

Figure 40 90th percentile waiting time for elective surgery, by urgency category,
October 2010 to December 2015

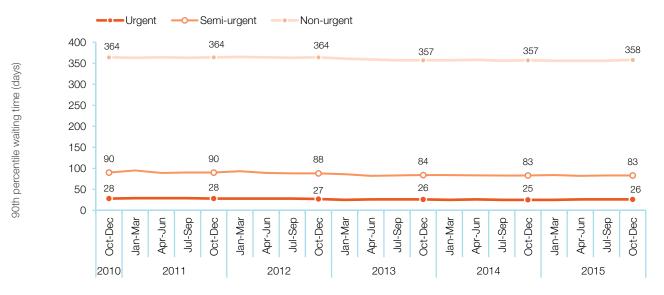

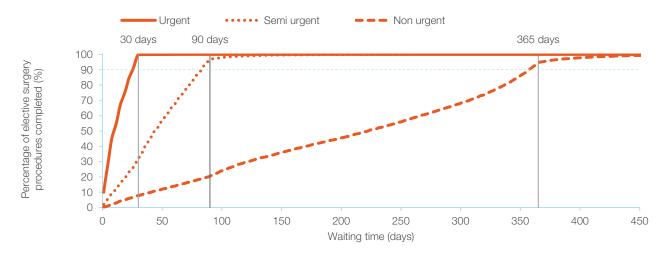

Figure 41 Cumulative percentage of elective surgery completed by day and urgency category,
October to December 2015

Is there variation in the waiting times for elective surgery?

During the October to December 2015 quarter, there was variation between and within hospital peer groups in the 90th percentile waiting times for elective surgery. This variation was most marked for patients requiring non-urgent surgery (Figure 42).

Across specialty groups, median waiting times increased or remained unchanged this quarter, compared with the same quarter last year, with the exception of urology and medical surgery (both decreased by four days). Median waiting times ranged from 20 days for vascular surgery to 204 days for ophthalmological surgery (Figure 43).

Across common surgical procedures, myringoplasty/tympanoplasty (321 days), septoplasty (311 days) and total knee replacement (288 days) had the longest median waiting times this quarter. Othergeneral (22 days), coronary artery bypass graft (28 days) and cystoscopy (29 days) had the shortest median waiting times (Figure 44).

Due to the large amount of information presented, individual facilities are not identified in Figure 42.

This information is available in Healthcare Observer.

How many elective surgery procedures were performed within the recommended timeframes?

Most elective surgery procedures (97%) were performed on time this quarter – 100% of urgent surgery, 97% of semi-urgent surgery and 95% of non-urgent surgery (Figure 45). These results have been largely stable for all urgency categories in the same quarter over the past three years (Figure 46).

Figure 47 shows the percentage of elective surgery performed on time by individual hospitals this quarter (Y-axis) and the percentage point change since the same quarter last year (X-axis). Hospitals shown above the blue NSW line had a higher percentage of

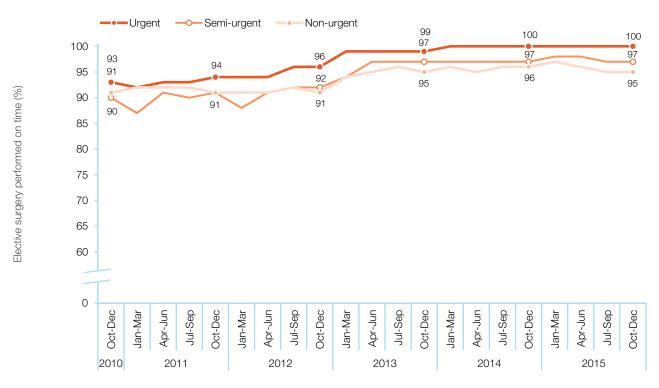

surgery performed on time this quarter compared with the overall NSW result, while those below this line had a lower percentage compared with the overall NSW result. Hospitals shown to the left of the vertical '0' line had lower results, compared with the same quarter last year, while those shown to the right of the vertical line had higher results.

Hospitals in the upper right quadrant of Figure 47 have achieved higher results than NSW overall, and increased the percentage of elective surgery performed on time this quarter, compared with the same quarter last year. Hospitals in the upper left

Figure 45 Percentage of elective surgery procedures performed on time, by urgency,
October to December 2015

			Same quarter last year	Percentage point change since one year ago
All elective surgery		97%	97%	unchanged
Urgent	Recommended: 30 days	100%	100%	unchanged
Semi-urgent	Recommended: 90 days	97%	97%	unchanged
Non-urgent	Recommended: 365 days	95%	96%	-1

Figure 46 Percentage of elective surgery procedures performed on time, by urgency,
October 2010 to December 2015

quadrant also achieved results higher than NSW this quarter but decreased the percentage of elective surgery performed on time, compared with the same quarter last year.

Hospitals in the lower right quadrant had results that were lower than NSW overall, but increased the percentage of elective surgery performed on time this quarter, compared with the same quarter last year. Hospitals in the lower left quadrant had results that were lower than NSW and decreased the percentage of elective surgery performed on time, compared with the same quarter last year.

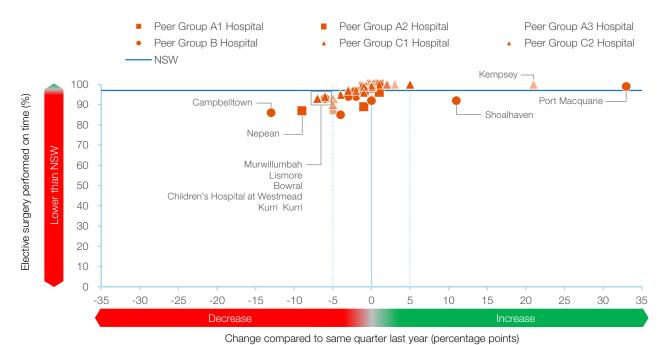

Hospitals identified in Figure 47 are those that have increased or decreased the percentage of elective surgery performed on time this quarter by more than

five percentage points, compared with the same quarter last year.

This quarter, the percentage of surgery performed on time increased in 21 out of 82 hospitals. Of these, three increased by more than 10 percentage points.

The percentage of surgery performed on time decreased in 33 hospitals. Of these, seven hospitals decreased by more than five percentage points, including one that decreased by more than 10 percentage points, compared with the same quarter last year (Figure 47).

Percentage of elective surgery performed on time and percentage point change since same quarter last year, hospitals by peer group, October to December 2015

Is there variation by specialty in the percentage of elective surgery performed on time?

The percentage of elective surgery procedures performed on time reached almost 100% this quarter across several specialty groups.

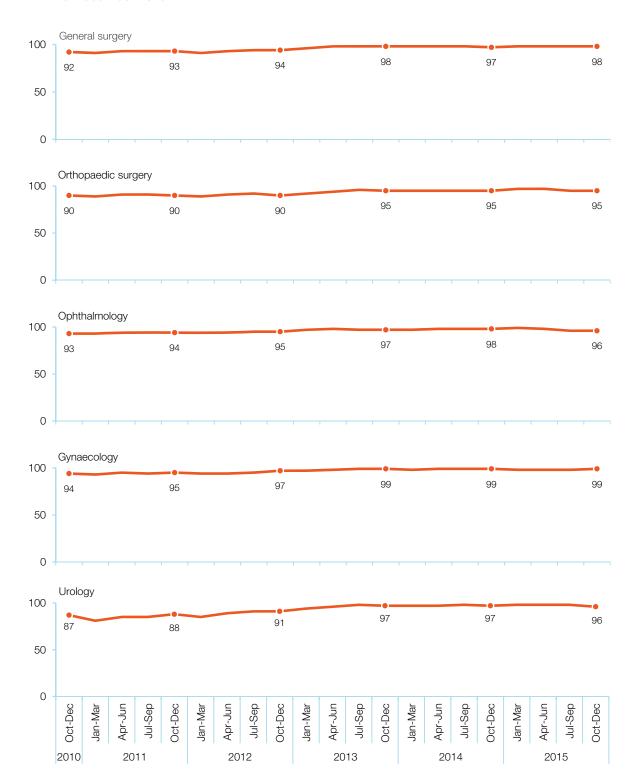

Gynaecology and vascular surgery had the highest percentage of patients who received surgery on time this quarter (both 99%). Ear, nose and throat surgery and orthopaedic surgery (91% and 95% respectively) had the lowest (Figure 48).

Figure 49 shows change over the past five years in the percentage of elective surgery performed on time for the five highest volume surgical specialty groups. Urology and general surgery have seen the largest increase in the percentage of elective surgery completed within recommended timeframes since October to December 2010 (nine and six percentage point increase respectively).

Figure 48 Percentage of elective surgery performed on time, by specialty, October to December 2015

	Number of procedures	Percentage on time		Percentage point change since one year ago
General surgery	13,218	98%	97%	1
Orthopaedic surgery	8,497	95%	95%	unchanged
Ophthalmology	7,171	96%	98%	-2
Gynaecology	6,984	99%	99%	unchanged
Urology	6,970	96%	97%	-1
Ear, nose and throat surgery	4,338	91%	94%	-3
Plastic surgery	2,230	97%	98%	-1
Vascular surgery	1,545	99%	98%	1
Neurosurgery	1,096	98%	98%	unchanged
Cardiothoracic surgery	944	98%	99%	-1
Medical	445	98%	98%	unchanged

Figure 49 Percentage of elective surgery performed on time, by specialty, October 2010 to December 2015

Percentage of elective surgery procedures performed on time by specialty (%)

Is there variation by common procedure in the percentage of elective surgery performed on time?

The percentage of elective surgery procedures performed on time reached almost 100% this quarter across several common procedures.

Hysteroscopy (99%), coronary artery bypass graft, cholecystectomy, and varicose vein stripping and ligation (all 98%) had the highest percentage of patients who received surgery on time this quarter, while myringoplasty/tympanoplasty (80%) and septoplasty (89%) had the lowest. Varicose vein stripping and ligation had the largest increase in the percentage of surgery performed on time

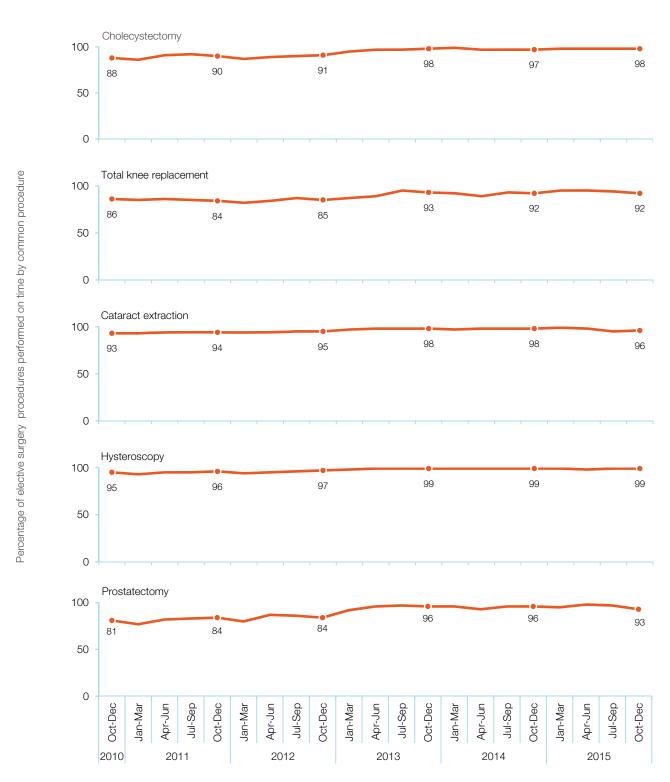

this quarter compared with the same quarter last year (up two percentage points). Myringoplasty/ tympanoplasty had the largest decrease (down seven percentage points) (Figure 50).

Figure 51 shows change over the past five years in the percentage of surgery performed on time across key common procedures in five of the highest volume specialties. Since the same quarter in 2010, prostatectomy and cholecystectomy have seen the largest increase in the percentage of on-time surgery (12 and 10 percentage point increase respectively).

Figure 50 Percentage of elective surgery performed on time, by common procedure,
October to December 2015

	Number of procedures	Percentage on time	Same quarter last year	Percentage point change since one year ago
Cataract extraction	5,627	96%	98%	-2
Cystoscopy	3,065	97%	97%	unchanged
Hysteroscopy	2,293	99%	99%	unchanged
Other - General	1,727	97%	97%	unchanged
Cholecystectomy	1,622	98%	97%	1
Total knee replacement	1,564	92%	92%	unchanged
Inguinal herniorrhaphy	1,507	97%	96%	1
Tonsillectomy	1,424	92%	94%	-2
Total hip replacement	900	95%	94%	1
Prostatectomy	604	93%	96%	-3
Abdominal hysterectomy	587	97%	98%	-1
Septoplasty	421	89%	92%	-3
Haemorrhoidectomy	339	96%	97%	-1
Varicose veins stripping and ligation	309	98%	96%	2
Coronary artery bypass graft	201	98%	98%	unchanged
Myringoplasty/Tympanoplasty	91	80%	87%	-7
Myringotomy	72	93%	99%	-6

Terms and classifications

Table 4 Terms and classifications used in the report

All presentations All emergency and non-emergency attendances at the emergency presentations All presentations that have a triage category and are coded as or unplanned return visits or disaster. Presentation time Presentation time is the earliest time recorded of the patient be and the earlier of the following fields in the emergency visit data	
or unplanned return visits or disaster. Presentation time Presentation time is the earliest time recorded of the patient be and the earlier of the following fields in the emergency visit data	emergency presentations
and the earlier of the following fields in the emergency visit data	
Information Exchange (HIE):	-
Arrival time: the date and time the patient presented at the ED)
Triage time: the date and time when the patient was assessed Times to starting treatment and times to leaving the ED are bot presentation time.	
Treatment time is the earlier of the following fields in the ED visit	it database of the HIE:
First seen by clinician time: the date and time when the patie medical officer and has a physical examination / treatment per their presenting problem(s)	
First seen by nurse time: the date and time when the patient nurse and has an assessment/treatment performed that is relepresenting problem(s).	-
Some patinets are excluded from ED treatment time measures calculation requirements.	due to
Median time to starting treatment The time from presentation by which half of patients started tre patients took equal to or longer than this time.	atment. The other half of
95th percentile time to starting treatment The time from presentation by which 95% of patients started treatment patients took equal to or longer than this time.	reatment. The final 5% of
Departure time BHI has revised the definition used for calculating the time take with the definition of the Commonwealth National Emergency A Departure time is defined as follows:	
For patients who were treated and discharged, departure time treatment was completed. For all other patients, departure time patient actually left the ED.	
Median time to leaving the ED The time within which half the patients left the ED. The other had to or longer than this time. The median time to leaving the ED is presentations with a valid departure time.	
95th percentile time to leaving the ED The time by which 95% of patients left the ED. The remaining 5 longer than this time. The 95th percentile time to leaving the EL presentations with a valid departure time.	•
Mode of separation The way in which a patient leaves the ED.	
Emergency presentations by mode of separation includes all p	resentations at the ED tha

Table 4 Terms and classifications used in the report (cont)

Emergency departments	
Percentage of patients leaving the ED within four hours	The percentage of patients leaving ED within four hours is calculated from all ED presentations with a valid time to departing the ED.
	The percentage of patients leaving the ED within four hours reported in <i>Hospital Quarterly</i> is not directly comparable to figures reported by the NSW Ministry of Health or the Commonwealth due to slight differences in definitions, period of reporting and the number of hospitals included.
	Revision of departure time definition, together with the inclusion of 14 additional EDs in this issue of <i>Hospital Quarterly</i> has resulted in a two percentage point increase in the percentage of patients leaving the ED within four hours than would have otherwise been reported this quarter. For more information visit bhi.nsw.gov.au
Transfer of care time	The period between arrival of patients at the ED by ambulance and transfer of responsibility for their care from paramedics to ED staff in an ED treatment zone. Transfer of care time is calculated for records that can be matched between the ED and ambulance information systems. This report includes transfer of care times for matched records only.
Triage category	A classification system based on how urgent the patient's need is for treatment:
	Triage 1: Resuscitation (for example, cardiac arrest) Triage 2: Emergency (for example, chest pain, severe burns) Triage 3: Urgent (for example, moderate blood loss, dehydration) Triage 4: Semi-urgent (for example, sprained ankle, earache) Triage 5: Non-urgent (for example, small cuts, abrasions).

Hospital admissions	
Episode of care	A period of care in a hospital or other healthcare facility with a defined start and end.
	When a person is admitted to hospital they begin what is termed an admitted patient episode or 'episode of care'. Acute episodes are typically short-term admissions for immediate care or treatment. Non-acute episodes include admissions for rehabilitation, palliative care and other non-acute reasons.
	Patients can have more than one episode of care during the same hospital admission. For example, a patient may begin with acute care and then change to rehabilitation or palliative care.
Stay type	Admitted patient episodes can be for 'same-day' or 'overnight' care. Same-day refers to patients who are admitted and discharged on the same day. Overnight refers to patients who spend at least one night in hospital.
	Admitted patient episodes can be either 'planned' or 'unplanned'. Planned refers to admissions that are arranged in advance (for example, patients who are admitted for planned elective surgery). Unplanned refers to emergency admissions (for example, for unplanned surgical patients).
Average length of stay	The total number of days in hospital for all admitted patient episodes (including sameday and overnight patients) divided by the total number of admitted patient episodes. The average length of stay is usually measured from midnight.
Bed days	Bed days are calculated for all admitted patient episodes completed during the reference period. Total acute bed days is the sum of bed days for all acute episodes with an episode end date within the defined period. Total acute bed days for an overnight episode is the difference, in days, between the episode start date and the episode end date, minus the number of episode leave days recorded. Same-day episodes count as one bed day.

Terms and classifications

Table 4 Terms and classifications used in the report (cont)

Common procedure	Commonly performed elective surgery procedures.
Specialty	The area of clinical expertise held by the doctor who performed the surgery. Medical (specialty) refers to any surgery performed by a non-specialist medical practitioner.
Median waiting time	The number of days by which half of patients received surgery. The other half took equal to or longer than this time.
90th percentile waiting time	The number of days by which 90% of patients received surgery. The remaining 10% took equal to or longer than this time.
Urgency category	A classification system based on how urgent the patient's need for surgery is: Urgent surgery: Admission within 30 days is desirable for a condition that has potential to deteriorate quickly and become an emergency Semi-urgent surgery: Admission within 90 days is desirable for a condition unlikely to deteriorate quickly Non-urgent surgery: Admission within 365 days acceptable for a condition unlikely to deteriorate quickly.
Staged surgery	Surgery that, for medical reasons, cannot take place before a certain amount of time has elapsed. BHI uses this term to define all patients that could be identified as being a staged patient for most of their time on the waiting list and all non-urgent cystoscopy patients.
	Because of differences in how hospitals have historically coded cystoscopy, BHI includes all non-urgent cystoscopy in the staged surgery category for measures of surgical activity.
Elective surgery waiting list	Patients ready for elective surgery and on the waiting list excludes those waiting for staged procedures. Patients ready for non-urgent surgery on the waiting list also excludes those waiting for non-urgent cystoscopy.
	Patients not ready for surgery on the waiting list includes those waiting for staged procedures, non-urgent cystoscopy, and patients currently not available for personal reasons.
	The time a patient waited for the initial appointment with a specialist is not included in the time a patient spent on the waiting list for elective surgery.

Appendix tables

These tables present activity and performance measures for individual hospitals from principal referral (peer group A1), paediatric specialist hospitals (peer group A2), ungrouped acute – tertiary referral hospitals (peer group A3), major hospitals (peer group B), district group 1 (peer group C1) and district group 2 hospitals (peer group C2). Information for smaller hospitals is presented under the category 'Other'.

Hospital admissions

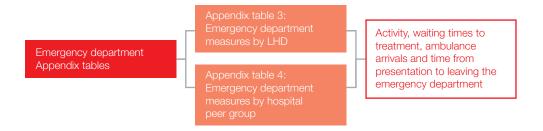

Appendix tables 1 and 2 present hospital admission activity measures for public hospitals in NSW for this quarter, by local health district (LHD) and hospital peer group.

About the Bureau of Health Information

The Bureau of Health Information (BHI) is a board-governed organisation that provides independent information about the performance of the NSW public healthcare system.

BHI was established in 2009 to provide system-wide support through transparent reporting.

BHI supports the accountability of the healthcare system by providing regular and detailed information to the community, government and healthcare professionals. This in turn supports quality improvement by highlighting how well the healthcare system is functioning and where there are opportunities to improve.

BHI manages the NSW Patient Survey Program, gathering information from patients about their experiences in public hospitals and other healthcare facilities.

BHI publishes a range of reports and tools that provide relevant, accurate and impartial information about how the health system is measuring up in terms of:

- Accessibility healthcare when and where needed
- Appropriateness the right healthcare, the right way
- Effectiveness making a difference for patients
- Efficiency value for money
- Equity health for all, healthcare that's fair
- Sustainability caring for the future

BHI's work relies on the efforts of a wide range of healthcare, data and policy experts. All of our assessment efforts leverage the work of hospital coders, analysts, technicians and healthcare providers who gather, codify and report data. Our public reporting of performance information is enabled and enhanced by the infrastructure, expertise and stewardship provided by colleagues from NSW Health and its pillar organisations.
